## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fulton in view of Hendershot, Jr. Fulton discloses in figures 4 and 5 a stator for a switched reluctance motor having three phase stator windings with stator windings of one phase wound around a first stator pole and every third main pole combined with a rotor with two N poles and two S poles. While one of the references cited in the Fulton patent is *Fully Pitched-Winding Switched-Reluctance and Stepping-Motor Arrangements* from an IEEE proceeding, Fulton does not describe his device as being a stepping motor. However, Hendershot, Jr. teaches in column 1 lines 44-49 that switched reluctance motors can be used as stepping motors. Since Fulton and Hendershot, Jr. are both from the same field of endeavor, it would have been obvious for one of ordinary skill in the art to have utilized the Fulton motor as a stepping motor.

In regard to claim 2, see figure 4.

In regard to claim 3, Fulton discloses the permanent magnet type stepping motor but does not disclose a plurality of teeth formed on the stator main poles. However, Hendershot, Jr. teaches using teeth in stepping motors in column 1 lines 51-60. Since Hendershot, Jr. and Fulton are both from the same field of endeavor, it would have been obvious for one of ordinary skill in

Art Unit: 2834

the art to have utilized teeth in the device of Fulton in order to facilitate the progression of the rotor at small step angles, thus increasing the precision and usefulness of the device.
